FISHES FROM INLAND NEW GUINEA

(Plate 2; Figure 1; Sketch map.)

By GILBERT P. WHITLEY, F.R.Z.S.
Curator of Fishes, The Australian Museum.

In 1954, my colleagues, Messrs. Ellis Le Geyt Troughton and Norman Camps, of the Australian Museum, visited inland New Guinea and secured a number of interesting freshwater fishes. The collecting localities of their expedition, in chronological order, were:

6. "Tomba".—South-west slopes of Mount Hagen range. 15 miles S. W. of W.N.W. of Mount Hagen airstrip. Altitude 8,300 ft (no fishes).
7. Cave in Kuber Range.—7 miles S. W. of S. of Mount Hagen airstrip. Altitude 7,800 ft (no fishes).

Two fluvifauna are represented: Localities 1, 5, and 6 are Leichhardtian with waters flowing to the south of New Guinea; localities 2, 3, 4, and 7 are Gaimardian, having northward-flowing rivers.
